The analysis of farm business records and the preparation of this report are done under the direction of Dennis Jackson, Agriculture Program Manager, South Central TC, Mankato Campus. Directing in a supervisory capacity are Dr. Ken Mills, President, South Central Technical College; John Murray, Education Specialist, Minnesota Technical College System; and Dr. Edgar Persons, Chairman, Agriculture Education Division, University of Minnesota. Data processing was done by Specialized Data Systems, Inc., Madison, Wisconsin. Special acknowledgments to Kathy Olson for her part in the preparation of this report.

INTRODUCTION

Farm Business Management education programs have been a part of the Agriculture Education program in Minnesota schools since 1952. From the early cooperative efforts of the State Department of Education and the Department of Agriculture Education (University of Minnesota), the program has expanded to serve over 6000 farm families each year in six farm management regions. Programs are now administered and managed by the Minnesota Technical College System through the Technical Colleges and local school districts.

The purpose of farm management education is to help farm families achieve their farm business and family goals. This is done through improved management, organization and efficiency of their farm operations. This purpose has not changed over the years.

To accomplish these purposes, programs have been organized to conform to the following guidelines:

- 1. Farm families enroll in specific management courses.
- 2. Each course has specific goals and objectives.
- 3. Courses are offered in sequence and farmers are expected to enroll in the first of the sequence of courses.
- 4. There is a continuity to each course. Each leads to the next course in the sequence.
- 5. Instruction occurs both in the classroom and on the farm with the farm family.

Programs organize their courses around the same central theme:

- Level 1 Introduction to Farm System Management
- Level 2 Farm System Analysis and Evaluation
- Level 3 Interpreting and Modifying Farm System Management Plans
- Level 4 Farm System Trends and Projections
- Level 5 Integrating Current Information Into Farm System Plans
- Level 6 Examining the Context of Farm System management Plans

Like most educational programs, members benefit from the instruction in relation to how much effort they put into study. Some farmers have benefitted more, and some less, depending on how seriously they studied the results of their business analysis and the kinds of decisions they made as a result of their analysis.

The farm business and enterprise analysis format allocates all specific and general farm expenses to each farm enterprise. The allocation of all costs makes the analysis a more useful report to be used for long range planning, short term cash purchase planning and cash flow projections.

DESCRIPTION OF ANALYSIS TABLES 200 SERIES

TABLE 200 is a Cash Statement of Operator's Farm Profit and Loss. It provides a detailed picture of cash incomes and expenditures, as well as grouping them into categories. It shows the Net Cash Income for the farm operation.

TABLE 210 provides the Accrual Statement of Operator's Farm Profit or Loss. The Net Cash Income from Table 200 is adjusted for the change in inventory value of current assets such as grain and market livestock to determine the Net Operating Income.

Depreciation and Capital Adjustments of intermediate and long term assets such as machinery, buildings and land, and other adjustments for changes in Accounts Payable and Delinquencies are then added or subtracted to determine the Net Farm Profit or Loss.

TABLE 220 reports various Measures of Farm Profitability, Liquidity and Solvency.

Profitability is reported as:

- 1) Return to Capital, Family Labor & Management
- 2) Net Return to Operator's Labor & Management
- 3) Net Return to Labor & Management (fulltime equivalent)
- 4) Return to Farm Capital
- 5) Return to Operator Equity

Liquidity is shown as the amount available to service non-real estate debt and the years required to turnover non-real estate debt, both determined after paying family living expenses and servicing real estate debt.

Solvency is shown as Operator Equity as well as the percent in debt by category.

TABLE 230 shows various measures of farm size, ie; acres, units of work accomplished, number of workers on the farm, and operator investment. This table also provides a brief summary of crop and livestock production and cost for the year.

TABLE 250 shows the Operator's Financial Position and Net Worth by providing a categorical listing of operator's assets (both book value and market value), liabilities, and equity (book and market).

TABLE 260 reports various ratios derived from Table 250, the Balance Sheet. Next year this table will also report the sixteen Financial Measures recommended by the American Bankers Association Financial Standards Task Force.

NOTE: The Accuracy/Reliability Check on the previous (facing) page shows the accuracy of the farm record in reporting cash, liabilities and net worth.

EXPLANATION OF TABLE 260 RATIOS

<u>CURRENT RATIO</u> (current assets divided by liabilities) is a measure of liquidity that indicates the shortrun ability of the business to service debt. It demonstrates the adequacy of current assets, if liquidated, to pay off annual debts as they come due. Current assets typically have a life of one year or less.

INTERMEDIATE RATIO (intermediate assets divided by intermediate liabilities). Intermediate assets and liabilities are those where the finances used are converted into product over a period of from one to ten years. Examples may be breeding stock, machinery and equipment. An increase in the ratio over a period of time is a favorable sign.

WORKING RATIO (current and intermediate assets divided by current and intermediate liabilities). It is desirable for this ratio to increase over time. It is also desirable for this ratio to be higher than the fixed ratio and the net capital ratio. The farm business needs to have sufficient liquid assets and management flexibility to absorb price decreases and other factors negatively affecting current and intermediate asset values.

FIXED RATIO (long term assets divided by long term liabilities). This ratio should be in excess of 1.00, and should be increasing over time. However, this ratio should not be increased at the expense of a safe working ratio.

NET CAPITAL RATIO (total assets divided by total liabilities). This ratio is one of three measures of solvency; how much value remains if all assets are converted to cash at inventoried value and the total debt is paid. This ratio reflects the risk-bearing capacity of the farm business by showing the percentage that assets could decline in value and still cover liabilities. The higher the ratio number, the better the risk. A ratio of less than 1.00 = insolvent, a ratio of 1.00 = a net worth of zero.

EQUITY/ASSET RATIO (total equity divided by total assets) shows the portion of total assets paid for and owned by the operator clear of financial claims. A ratio of 0.80 shows that the operator owns 80% of all assets and a ratio of 0.44 shows he owns only 44% of total assets. This ratio should be increasing over time.

<u>DEBT/EQUITY RATIO</u> (total liabilities divided by total equity) is another measure of solvency, showing the relationship between debt and equity. A ratio of 1.00 indicates that equity and debt are equal. That would be equivalent to a Net Capital Ratio of 2:1, or an Equity/Asset Ratio of 0.5:1. All measures of solvency use the same three measures of financial position to express relationships between assets, liabilities and net worth (or equity). Lenders prefer a debt/equity ratio of less than 1.00.

<u>DEBT STRUCTURE RATIO</u> (current liabilities divided by total liabilities). The lower the current debt structure ratio, the more liquid the business. A ratio of 0.10 means that only \$1.00 of every \$10.00 of total debt must be paid within the next year. A ratio of 0.50 means that one-half of the total debt is due within the next year.

MEASURES OF FARM ORGANIZATION AND MANAGEMENT EFFICIENCY

The following explanations and definitions are for use in interpreting Table 8.

- 1. Return to Operator's Labor & Management A measure of the relative financial return for the operators labor, taking into account all income and expense, cash and non-cash, including a charge for the use of farm capital. This is based on the operators share of the business and is found also in Table 6.
- 2. <u>Crop Yield Index</u> A measure of the crop yield level for all crops produced expressed as a percentage of the average; the average being 100%.
- 3. Return over all Listed Cost Per Tillable Acre (Exc. pasture)
 This is the net return per tillable crop acre after all
 variable and allocated costs have been paid.
- 4. <u>Gross Return per Acre</u> An additional measure of crop selection based on total production times an average price for the crops, plus other crop income.
- 5. Return per \$100 Feed Fed to Productive Livestock Measures the general level of efficiency for all livestock. It is expressed as a percentage of the average and combines the individual livestock indexes into one figure.
- 6. <u>Livestock Units per 100 Acres</u> A measure of livestock density or population. Unit values are assigned to the various classes of livestock. Unit values are found on page 64.
- 7. Size of Business Work Units A measure of the total work load. A unit of work is a standardized measure of productivity allowing comparison between diverse farm operations with various enterprises. Work unit values assigned to each class of livestock, each crop, and to other tasks utilizing farm labor are listed on page 64.
- 8. Work Units per Worker Measures labor efficiency. It is the total work units divided by the number of workers on the farm including the operator, hired labor and family labor.
- 9. Power Machinery, Equipment and Building Expense per Work Unit A measure of expense control. It is the total of items 31 through 36 in Table 3 divided by the number of Work Units.

Other items listed on Table 8 are related to the above measures and serve to further define and describe the efficiency level of the farm business. Note should be taken that items listed in Table 8 are to be considered in the light of the individual farm and farm operator. Although in general, an above average level for each factor listed would indicate an above average earnings, this may not be true when individual farms are considered. The interrelationship of factors varies from farm to farm.

DESCRIPTION OF ANALYSIS TABLES 1, 3 & 4

Non Farm Income and Household & Personal Expense (table 4) provides a listing on non-farm sources of income and expense for the farm family. Household and personal accounts are important if the family is to manage its financial affairs wisely. This is an "Operators Share" table, and includes only those farms where complete household and personal accounts were kept.

Resources Used in the Business (table 1) is a "whole farm" table that includes the landlord's share of the investment for rented farms. It lists the categories of farm capital for the average, 20% most profitable, and 20% least profitable farms.

Livestock, crops, seed and feed reflect a conservative market price at the time the inventory is taken. Machinery, equipment and building values reflect cost less depreciation. Land is generally valued at cost, but may have been adjusted to reflect long term changes in value.

Farm size is measured by investment, acres, number of workers and work units. Work units provide a measure of the work accomplished. A clue to the farm organization is indicated by the distribution of work units between crops and livestock.

Enterprise Statement (table 3) is a "whole farm" table that provides an accrued picture of each part of the farm business as an income center or as an expense center. Cash receipts and expenses are adjusted for changes in inventory for each enterprise from Table 1 in order to show net increases and net decreases.

TABLE 10 - INDIVIDUAL CROP ENTERPRISE ANALYSIS

The individual crop analysis table shows acres, yield, value per unit (harvest time), and gross return per acre for each crop raised.

Costs such as fertilizer, chemicals, seed, crop drying, special hired labor and custom work are costs that are assigned to each individual crop by the operator. These costs are shown as <u>variable costs</u>.

Other costs, called <u>allocated costs</u>, are calculated from the actual costs incurred. They are allocated by formula. The power and machinery expense is divided into ownership and operation costs. Allocated cost calculations are assigned to each productive enterprise.

Land cost (line 37) on owned land represents the actual land ownership cost and includes costs for interest, real estate taxes and improvement costs on the land. Land cost for rented land is the actual rent paid for the use of the land, as reported in the farmer's records.

Costs for hired labor (line 39) and non-real estate & building interest (line 41) are actual overhead costs which were not assigned to a specific enterprise. They are allocated to each enterprise by formula.

The total crop return minus the variable and allocated costs equals the return over listed costs shown on line 44.

All crop enterprises produced on a farm are analyzed separately. This allows the operator to compare the costs and returns for each individual crop.

Fair rental value (line 49) is a value the operator assigns to his owned land. Land opportunity ownership cost (line 50) represents the total costs associated with owning land; real estate taxes, land improvement costs, and a 7% opportunity cost on land investment. These costs may be greater than the actual cost reported on line 37. Both lines 49 & 50 represent opportunity costs for owned land. Although it may not be necessary to cover these costs in a particular year, they should be considered as a long term cost of investing in and owning land.

Total production cost including adjusted family living (line 54A) represents the total cost per unit associated with producing the crop plus the adjusted cash family living expenses as reported on Table 4. Family living costs are allocated to each enterprise by formula and represent the proportional share that each enterprise should contribute.

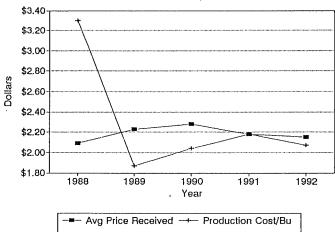

SUPPLEMENTARY MANAGEMENT INFORMATION FOR CROPS

COSTS AND RETURNS FROM LIVESTOCK ENTERPRISES

Productive livestock enterprises are an important part of many farm businesses in Minnesota. Farms involved in this report may have one or more livestock enterprises. The following tables pertain to these livestock enterprises.

Since feed is the largest single item of cost for all classes of livestock, return over feed costs has been used to classify farm livestock enterprises into high, low and average groups.

Other cash costs relatively easy to identify and classify in the farm records are listed in each of the tables as other direct costs.

Allocated costs include interest charges to the enterprise, allocated charges for hired labor, utilities, power and machinery, livestock equipment and building and fence costs. These costs are allocated to each livestock enterprise by the computer using a carefully devised formula to make the proper allocations.

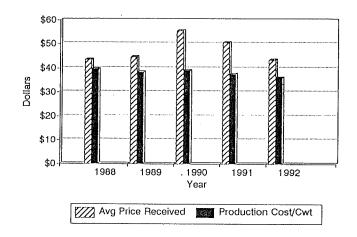

Each enterprise table includes supplementary management information. This information can provide clues indicating the strengths and weaknesses of each enterprise.

Many Farrow-to-Finish producers prefer to split their enterprise into two parts -- farrowing and finishing -- to get more complete data on each phase of the operation. Table 11E allows these producers to separate their enterprise and then "combine" it to get a picture of the total hog enterprise. Table 11E is actually a farrow-to-finish table. Since the enterprises reported in Table 11E are also included in Tables 11B and 11C, they are not included in Table 11A.

Total Cost Including Family Living (the last line) represents the total production cost per unit associated with producing the commodity plus the adjusted cash living expense as reported on Table 4. These family living costs are allocated by work units formula and represent the proportional share that each enterprise should contribute.

#### EXPLANATION OF WORK UNITS

The total "Work Units" for a farm business is one measure of the size of that farm business. Originally, a "unit of work" represented the average accomplishment of a farm worker in a ten hour day. With today's facilities and mechanization the relationship to a specific unit of time is no longer relevant. However, the Work Unit remains a viable method of measuring accomplishment and provides a stable means of comparing size of dissimilar farm businesses with varying enterprises. The Work Unit concept also provides a rational method for allocating input costs between enterprises based on relative input requirements. The number of Work Units for various classes of livestock and crops are presented below.

# NUMBER OF WORK UNITS FOR LIVESTOCK AND CROP ENTERPRISES

#### 1992 - THE YEAR IN REVIEW

** *** *** *** ***

Dennis Jackson, Regional Agriculture Program Manager South Central Technical College, Mankato

Considering the weather and market prices, 1992 was better than expected for the "average" farm operator in South Central Minnesota. Since the "average" farm operator is a figment of a statistician's imagination, 1992 can best be described as a wonderful year for some, a terrible year for others, and just another year for many. As anticipated, there was a very wide range from high to low individuals again this year. The difference in labor earnings from extreme top to extreme bottom was nearly \$500,000.

Despite all that, averages can give us a good picture of the year in general. Average Operator Labor Earnings for 1992 were \$16,812 compared to \$12,286 for 1991. Return to Capital & Family Labor averaged \$29,475 in 1992 compared to \$25,636 the previous year. Increase in Net Worth was \$8,363 compared to a meager \$1,234 a year earlier. The table below provides a longer term perspective by comparing 1992 with an average of the previous five year period, 1987 to 1991:

	1992	5 II AVQ
Operator Labor Earnings	16,812	32,417
Return to Capital & Family Labor	29,475	41,274
Increase in Net Worth	8,363	20,212

As can be seen, 1992 was an improvement over 1991, but was well below the average of the previous five years. Net Cash Farm Income for 1992 was \$35,319, but an increase of commodity inventories (grain and market livestock) of \$5,644, a decline of capital asset values of \$12,382, and an increase in accounts payable and delinquencies of \$190 resulted in a Net Farm Profit of \$28,391. In comparison, 1991 showed Net Cash Farm Income of \$38,954, but lower commodity inventories, decreased asset values and other adjustments resulted in a Net Farm Profit of only \$22,586. So, although 1992 Net Cash Farm Income was about \$3,600 less than the previous year, the overall profitability of the average farm business gained by \$5,800 -- an increase of over 25%.

1992 was a stressful year for most farm operators in South Central Minnesota as a result of a late spring frost, an early fall frost, and generally lower commodity prices. Some comparisons between 1992, the previous year, and the average of the five preceding years are shown below:

	<u> 1992</u>	1991	5 Yr Avq
Corn, yield/acre, bushels	136.3	125.5	124.6
Soybeans, yield/acre, bushels	39.7	37.1	39.6
Corn, avg. price received/bu.	2.15	2.18	2.34
Soybeans, avg. price rec'd/bu.	5.42	5.40	5.98
Finishing Hogs, avg. price rec'd	43.35	50.25	48.84
Feeder Pigs, avg. price rec'd	38.67	51.50	47.26
Fed Cattle, avg. price rec'd	71.52	70.92	68.07
Milk, avg. price received	13.04	11.73	12.27

As can be seen in the crops category, a comparison with the five preceding years shows somewhat higher yields and lower prices for 1992. The yield difference would not have been nearly so great, had it not been for the crop disaster of the 1988 drought which really pulled down the five year average. The unfortunate part of the crops picture is that while corn and soybean prices declined by 9%, per acre production costs increased by nearly 3.5%

In the livestock category, hog and feeder pig production costs dropped 7%. Unfortunately market prices dropped nearly 15% during the same timeframe. On a more positive note, while milk and fed cattle costs increased 2.5%, market prices increased 5.5%. Despite some meager positive numbers for dairy and fed cattle, the overall picture shows that the cost:price squeeze continues to have a real impact on profitability.

A comparison with ten years ago provides some food for thought.

	1992	<u> 1982</u>
Corn, yield/acre, bushels	136.3	133.6
Soybeans, yield/acre, bushels	39.7	39.3
Corn, production cost/bu*	\$ 2.07	\$ 2.38
Soybeans, production cost/bu*	\$ 5.04	\$ 5.95
Dairy Cow, milk production	17,388	14,007
Milk, production cost/cwt*	\$ 10.17	\$ 10.47
Milk, avg price received/cwt	\$ 13.04	\$ 12.99
F-F Hogs, pigs weaned/litter	8.4	7.6
F-F Hogs, lb. feed/cwt gain	369.3	428.4
F-F Hogs, production cost/cwt*	\$ 36.19	\$ 38.91
F-F Hogs, avg price rec'd/cwt	\$ 43.46	\$ 53.57

*1982 costs adjusted to include interest, general labor, utilities & misc. farm expenses which were not allocated in the 1982 analysis.

Comparing 1992 with 1982 shows that crop yields were not significantly different, but production costs have dropped. Grain producers have become more efficient out of necessity. Can we get even better? Do we accomplish it by reducing input costs further, or by better managing our inputs to increase yields?

Looking at livestock, dairymen have gotten more productive, but the increased productivity has not much more than kept ahead of increased production costs, a decrease of only 30 cents/cwt of milk. In hog production, we've improved our productivity by 0.8 pig per litter, improved our feeding efficiency by 14%, and reduced our costs by \$2.72 per cwt over the last ten years. But when we consider the superior genetics and improved mother lines, the investments in facilities, and the knowledge we've acquired about nutrition and herd health, have we truly made the gains we could have in ten years of progress?

A brief look at a sampling of the 1992 high return producers provides some suggestions and some goals for the future.

Corn Soybeans	<u>Yield</u> 171.1 60.7	Cost/bu \$ 1.50 \$ 3.84	
Dairy P	roduction 20,587	Cost/cwt \$ 9.18	
F-F Hogs	Weaned 9.0	# Feed 330.0	Cost/cwt \$ 29.30

When we have solid data and are aware of the situation, and if we have some realistic goals to shoot for, we can take appropriate actions. That means doing things to improve production efficiency and contain costs, and taking steps to reduce other expenses such as capital purchases and family living expenses.

Capital purchases in 1992, at \$28,413, were down slightly from the \$28,749 spent in 1991. This follows an 11% decrease in capital purchases in 1991 compared to 1990. Obviously, replacement costs need to be measured against increased maintenance costs when deciding whether to upgrade or add machinery, but purchases can be (and are being) delayed somewhat.

1992 marks the first time in seven years that family living expenditures declined from the level of the previous year. Unlike 1991, when the average family borrowed to meet family living costs, the average farm family in 1992 lived within the available income. In 1992 the average family spent \$36,902 compared to \$42,472 in 1991. Cutting back on one's standard of living is never pleasant, but it is essential in years like 1991 and 1992.

When we consider all the sources of income, Net Cash Farm Income of \$35,319 and Non-Farm Income of \$15,182, we have spendable income of \$50,501. On the other side of the ledger are Capital Purchases of \$28,413, Real Estate Principal Payments of \$5,462, and Family Living Expenses of \$36,902 for a total of \$70,777. It's easy to see why borrowing was greater than debt repayment again in 1992. This is the fourth consecutive year that borrowing has exceeded debt repayment as it did in the late '70's and early '80's, and it's not a healthy trend. Farm operators paid \$288 less interest in 1992 than they did in 1991. Perhaps the lower interest rates are making us complacent about higher debt loads.

Despite the difficulties of 1992, spring brings renewed optimism to farmers. Optimism, guided by the knowledge about one's own business that the Farm Business Analysis provides can result in well directed efforts to maximize production efficiency, control costs and make significant progress toward farm and family goals.

		V V

#### 1992 - THE YEAR IN REVIEW

Dennis Jackson, Regional Agriculture Program Manager South Central Technical College, Mankato

Considering the weather and market prices, 1992 was better than expected for the "average" farm operator in South Central Minnesota. Since the "average" farm operator is a figment of a statistician's imagination, 1992 can best be described as a wonderful year for some, a terrible year for others, and just another year for many. As anticipated, there was a very wide range from high to low individuals again this year. The difference in labor earnings from extreme top to extreme bottom was nearly \$500,000.

Despite all that, averages can give us a good picture of the year in general. Average Operator Labor Earnings for 1992 were \$16,812 compared to \$12,286 for 1991. Return to Capital & Family Labor averaged \$29,475 in 1992 compared to \$25,636 the previous year. Increase in Net Worth was \$8,363 compared to a meager \$1,234 a year earlier. The table below provides a longer term perspective by comparing 1992 with an average of the previous five year period, 1987 to 1991:

	<u> 1992 </u>	DVA 11 C
Operator Labor Earnings	16,812	32,417
Return to Capital & Family Labor	29,475	41,274
Increase in Net Worth	8,363	20,212

As can be seen, 1992 was an improvement over 1991, but was well below the average of the previous five years. Net Cash Farm Income for 1992 was \$35,319, but an increase of commodity inventories (grain and market livestock) of \$5,644, a decline of capital asset values of \$12,382, and an increase in accounts payable and delinquencies of \$190 resulted in a Net Farm Profit of \$28,391. In comparison, 1991 showed Net Cash Farm Income of \$38,954, but lower commodity inventories, decreased asset values and other adjustments resulted in a Net Farm Profit of only \$22,586. So, although 1992 Net Cash Farm Income was about \$3,600 less than the previous year, the overall profitability of the average farm business gained by \$5,800 -- an increase of over 25%.

1992 was a stressful year for most farm operators in South Central Minnesota as a result of a late spring frost, an early fall frost, and generally lower commodity prices. Some comparisons between 1992, the previous year, and the average of the five preceding years are shown below:

	<u> 1992 </u>	$_{1991}$	<u>5 Yr Avg</u>
Corn, yield/acre, bushels	136.3	125.5	124.6
Soybeans, yield/acre, bushels	39.7	37.1	39.6
Corn, avg. price received/bu.	2.15	2.18	2.34
Soybeans, avg. price rec'd/bu.	5.42	5.40	5.98
Finishing Hogs, avg. price rec'd	43.35	50.25	48.84
Feeder Pigs, avg. price rec'd	38.67	51.50	47.26
Fed Cattle, avg. price rec'd	71.52	70.92	68.07
Milk, avg. price received	13.04	11.73	12.27

As can be seen in the crops category, a comparison with the five preceding years shows somewhat higher yields and lower prices for 1992. The yield difference would not have been nearly so great, had it not been for the crop disaster of the 1988 drought which really pulled down the five year average. The unfortunate part of the crops picture is that while corn and soybean prices declined by 9%, per acre production costs increased by nearly 3.5%

In the livestock category, hog and feeder pig production costs dropped 7%. Unfortunately market prices dropped nearly 15% during the same timeframe. On a more positive note, while milk and fed cattle costs increased 2.5%, market prices increased 5.5%. Despite some meager positive numbers for dairy and fed cattle, the overall picture shows that the cost:price squeeze continues to have a real impact on profitability.

A comparison with ten years ago provides some food for thought.

	<u> 1992 </u>	<u> 1982</u>
Corn, yield/acre, bushels	136.3	133.6
Soybeans, yield/acre, bushels	39.7	39.3
Corn, production cost/bu*	\$ 2.07	\$ 2.38
Soybeans, production cost/bu*	\$ 5.04	\$ 5.95
Dairy Cow, milk production	17,388	14,007
Milk, production cost/cwt*	\$ 10.17	\$ 10.47
Milk, avg price received/cwt	\$ 13.04	\$ 12.99
F-F Hogs, pigs weaned/litter	8.4	7.6
F-F Hogs, 1b. feed/cwt gain	369.3	428.4
F-F Hogs, production cost/cwt*	\$ 36.19	\$ 38.91
F-F Hogs, avg price rec'd/cwt	\$ 43.46	\$ 53.57

*1982 costs adjusted to include interest, general labor, utilities & misc. farm expenses which were not allocated in the 1982 analysis.

Comparing 1992 with 1982 shows that crop yields were not significantly different, but production costs have dropped. Grain producers have become more efficient out of necessity. Can we get even better? Do we accomplish it by reducing input costs further, or by better managing our inputs to increase yields?

Looking at livestock, dairymen have gotten more productive, but the increased productivity has not much more than kept ahead of increased production costs, a decrease of only 30 cents/cwt of milk. In hog production, we've improved our productivity by 0.8 pig per litter, improved our feeding efficiency by 14%, and reduced our costs by \$2.72 per cwt over the last ten years. But when we consider the superior genetics and improved mother lines, the investments in facilities, and the knowledge we've acquired about nutrition and herd health, have we truly made the gains we could have in ten years of progress?

•

A brief look at a sampling of the 1992 high return producers provides some suggestions and some goals for the future.

Corn Soybeans	<u>Yield</u> 171.1 60.7	\$ 1.50 \$ 3.84	
Dairy P	roduction 20,587	<pre>Cost/cwt \$ 9.18</pre>	
F-F Hogs	Weaned 9.0	# Feed 330.0	Cost/cwt \$ 29.30

When we have solid data and are aware of the situation, and if we have some realistic goals to shoot for, we can take appropriate actions. That means doing things to improve production efficiency and contain costs, and taking steps to reduce other expenses such as capital purchases and family living expenses.

Capital purchases in 1992, at \$28,413, were down slightly from the \$28,749 spent in 1991. This follows an 11% decrease in capital purchases in 1991 compared to 1990. Obviously, replacement costs need to be measured against increased maintenance costs when deciding whether to upgrade or add machinery, but purchases can be (and are being) delayed somewhat.

1992 marks the first time in seven years that family living expenditures declined from the level of the previous year. Unlike 1991, when the average family borrowed to meet family living costs, the average family in 1992 lived within the available income. In 1992 the average family spent \$36,902 compared to \$42,472 in 1991. Cutting back on one's standard of living is never pleasant, but it is essential in years like 1991 and 1992.

When we consider all the sources of income, Net Cash Farm Income of \$35,319 and Non-Farm Income of \$15,182, we have spendable income of \$50,501. On the other side of the ledger are Capital Purchases of \$28,413, Real Estate Principal Payments of \$5,462, and Family Living Expenses of \$36,902 for a total of \$70,777. It's easy to see why borrowing was greater than debt repayment again in 1992. This is the fourth consecutive year that borrowing has exceeded debt repayment as it did in the late '70's and early '80's, and it's not a healthy trend. Farm operators paid \$288 less interest in 1992 than they did in 1991. Perhaps the lower interest rates are making us complacent about higher debt loads.

Despite the difficulties of 1992, spring brings renewed optimism to farmers. Optimism, guided by the knowledge about one's own business that the Farm Business Analysis provides can result in well directed efforts to maximize production efficiency, control costs and make significant progress toward farm and family goals.
